SourceBook

It's not enough to know what you have—you need to know how it's put together. This is why Bristol Capital pioneered the notion of the “PBX SourceBook” more than a decade ago.

With more than 30 graphical and textual reports ranging from graphic representations of IP & TDM stations, to full bay face layouts, the SourceBook provides a complete documentation of how a PBX is configured, down to the buttons on each set. And all the information is presented in a format that's easy to read and understand.

Nortel or Avaya PBX information in plain English

More than just a “data dump”, the SourceBook is an administrative tool. For example, the SourceBook's

“Action Items” report highlights programming conflicts and capacity issues before they affect your service. And the detailed equipment maps virtually eliminate the need for physical site surveys and help you proactively plan for system upgrades and capacity planning. All Information in the SourceBook is an accurate up-to-date reflection of the programming of the PBX, and is presented in ways meaningful to users and administrators alike. View your SourceBook online and keep a printed copy in the switch room for reference.

Schedule SourceBook updates throughout the year to keep an accurate view of your PBX and simplify the job of communications management.

Manage multiple locations without special software

Every InfoPlus SourceBook we produce is made available on the InfoPlus PBX Database, an especially useful tool for those of you that manage multiple locations (domestic and international). This dynamic database is equipped with tools designed to assist you with identifying capacity shortages, isolating system programming issues, and completing day-to-day maintenance tasks across all of your sites with a single logind ID and password.

“My customers use the SourceBook as a way to prepare budgets and strategically plan upgrades. My hats off to Bristol Capital for what is truly a great service offering.”

—Gary Lundberg, Verizon.
